4: pir4:*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

-!- FUNCTION: GLUTENINS ARE THE HIGH MOLECULAR WEIGHT SEED PROTEIN OF WHEAT ENDOSPERM. THOUGHT OBE RESPONSIBLE VISCO-ELASTIC PROPERTY OF WHEAT DOUGH.

-!- SUBUNIT: DISULFIDE-BRIDGE LINKED AGGREGATES.
-!- MISCELLANEOUS; GLUTENINS ARE CODED BY SEVERAL GENES ON GROUP 1 CHROMOSOMES OF WHEAT.
-!- MISCELLANEOUS; THE MATURE PROTEIN IS CHARACTERIZED BY NUMBER OF WELL PRESERVED REPEATS OF THE TWO MOTIFS: GC

The antibodies neutralise KDR activation. The immunoglobulin may be a multivalent single chain antibody, a diabody, a monovalent single chain antibody, a diabody, a criabody, a humanised antibody or a chimerised antibody. a criabody, a humanised antibody or a chimerised antibody. Crie immunoglobulin molecules bind specifically to an extracellular domain of the KDR receptor with the same affinity as VEGF. Overexpression of VEGF has been implicated in a number of human tumour cell lines including glioblastoma multiforme, hemangioblastoma, central nervous system neoplasms and AIDS associated Karposi's sarcoma. The antibodies therefore have applications in treating these conditions. This sequence encodes a preferred heavy chain complementary determining region of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

            The invention describes an antigen-binding protein (I) comprising a complex of two polypeptides (P1) and two second polypeptides (P2) which are stably associated in an immunoglobulin like complex. P1 has an antigen-binding site located to the N terminus of immunoglobulin (Ig) light chain constant domain (CL domain), and P2 has an antigen-binding site located to the N terminus of the CH1 domain. (I) is useful for: neutralising the activation of a vascular endothelial growth factor (VEGF) receptor; reducing tumour growth; inhibiting VEGF induced reducing endothelial cell proliferation; inhibiting VEGF induced
                                                                                                                                                                                             New bispecific immunoglobulin-like antigen-binding protein tumour growth and for inhibiting angiogenesis, comprises a two polypeptides and two second polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to novel immunoglobulin molecule that bind to kinase insert domain-containing receptor (KDR) (a human homologue of mouse foetal liver kinase (FLK)-1 receptor) with an affinity comparable to human vascular endothelial growth factor (VEGF) and that neutralises activation of KDR. Sequences of the invention are useful for neutralising the activation of KDR, for reducing tumour growth and for inhibiting angiogenesis. The present sequence is mouse anti-KDR plC11 scEV antibody heavy chain complementarity determining region 2 (CDRH2).
                                                                                                                                                                  Claim 55; Page 56; 64pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   its ligand; promoting interactions between immune cells and target cells; and in vivo and in vitro for investigative, diagnostic or treatment methods. The design of (I) provides for efficient production so that substantially all of the antigen-binding proteins produced are assembled in the desired configuration. (I) is bivalent and bispecific, homogeneous and in tetrameric form. The heavy chain constant domains which constitute the Fc region (e.g., CH2 and CH3 for an IGG molecule) of a natural antibody and which provide other antibody functions can be present. There is no requirement for processing in vitro to obtain the complete product. This peptide sequence represents the heavy chain variable domain complementarity determining region H2 (CDRH2) version #1 incorporated into an antigen-binding protein described in the method of the invention.
                          The invention relates to a novel antibody having a first antigen binding site specific for a first vascular endothelial growth factor (VEGF) receptor and a second antigen-binding site specific for a second VEGF receptor. The bispecific antigen-binding proteins block activation of the VEGF receptor and are useful for reducing or inhibiting VEGF-induced cellular functions such as mitogenesis of vascular endothelial cells and migration of leukaemia cells. The antibodies are useful for treating tumours and for in vivo or in vitro for investigative and diagnostic methods. This sequence represents a mouse peptide relating to the bispecific antibodies that bind to the VEGF receptors of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cytostatic; antibody; antigen binding site; VEGF receptor; leukaemia cell; vascular endothelial growth factor; tumour; bispecific antigen-binding protein; mouse; murine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       VEGF binding

                                                                extracellular domain of the KDR receptor with the same affinity VEGF. Overexpression of VEGF has been implicated in a number of human tumour cell lines including glioblastoma multiforme, hemangioblastoma, central nervous system neoplasms and AIDS associated Karposi's sarcoma. The antibodies therefore have
                                                                                                                                          New immunoglobulin molecules are described that bind kinase insert domain-containing receptor (KDR) with a comparable affinity to human vascular endothelial growth factor (VEGF). The antibodies neutralise KDR activation. The immunoglobulin may be a multivalent single chain antibody, a monovalent single chain antibody, a diabody, a triabody, a humanised antibody or a chimerised antibody. The immunoglobulin molecules bind specifically to an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   VEGF; vascular endothelial growth factor; KDR; kinase insert domain containing receptor; multivalent; monovalent; humanised antibody; chimeric antibody; tumour; diabody; triabody;

                                                                                                                                                                                                                                The present invention relates to novel immunoglobulin molecules that bind to kinase insert domain-containing receptor (KDR) (a human homologue of mouse foetal liver kinase (FIK)-1 receptor) with an affinity comparable to human vascular endothelial growth factor (VEGF) and that neutralises activation of KDR. Sequences of the invention are useful for neutralising the activation of KDR, for reducing tumour growth and for inhibiting angiogenesis. The present sequence is mouse anti-KDR plCl1 scFv antibody heavy chain variable region (VH).

                                                                                                                                                                                                                      and in vivo and in vitro for investigative, diagnostic or treatment methods. The design of (1) provides for efficient production so that substantially all of the antigen-binding proteins produced are assembled in the desired configuration. (I) is bivalent and bispecific homogeneous and in tetrameric form. The heavy chain constant domains which constitute the Fc region (e.g., CH2 and CH3 for an 1gG molecule) of a natural antibody and which provide other antibody functions can be present. There is no requirement for processing in vitro to obtain the complete product. This sequence represents a heavy chain variable domain (VH) incorporated into Fv, an engineered protein containing a heavy chain variable domain described in
                                                                                                                                                                Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           antigen-binding site located to the N terminus of immunoglobulin (Ig) light chain constant domain (CL domain), and P2 has an antigen-binding site located to the N terminus of the CH1 domain. (I) is useful for: neutralising the activation of a vascular endothelial growth factor (VEGF) receptor, reducing tumour growth; inhibiting angiogenesis, reducing endothelial cell proliferation; inhibiting VEGF induced reducing endothelial cell proliferation; inhibiting VEGF induced migration of human leukaemia cells; blocking interaction of approtein and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New bispecific immunoglobulin-like antigen-binding protein for reducing tumour growth and for inhibiting angiogenesis, comprises a complex of two polypeptides and two second polypeptides -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention describes an antigen-binding protein (I) comprising a complex of two polypeptides (P1) and two second polypeptides (P2) which are stably associated in an immunoglobulin like complex. P1 has an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 57; Page 57; 64pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Antigen-binding protein; cytostatic; angiogenesis vascular endothelial grow
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         N-PSDB; AAS20283.

The antibodies are useful for treating tumours and for in vivo or in vitro for investigative and diagnostic methods. This sequence represents a mouse protein relating to the bispecific antibodies that bind to the VEGF receptors of the invention.
                                                                                                                                                                                                    AAE25960 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel antibody having a first antigen binding site specific for a first vascular endothelial growth factor (VEGF) receptor and a second antigen-binding site specific for a second VEGF receptor. The bispecific antigen-binding proteins block activation of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             to kinase insert domain-containing receptor (KDR) (a human homologue of mouse foetal liver kinase (FLK)-1 receptor) with an affinity comparable to human vascular endothelial growth factor (VBGP) and that neutralises activation of KDR. Sequences of the invention are useful for neutralising the activation of KDR, for reducing tumour growth and for inhibiting angiogenesis. The present sequence is KDR binding immunoglobulin related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Zhu
                                                                                                                                                                                                                     Antigen-binding protein; single chain variable fragment; cytostatic; angiogenesis inhibitor; tumour; leukaemia; an vascular endothelial growth factor receptor; VEGF; cell proliferation inhibitor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC complex of two polypeptides (P1) and two second polypeptides (P2) which CC are stably associated in an immunoglobulin like complex. P1 has an CC antigen-binding site located to the N terminus of immunoglobulin (Ig) CI ight chain constant domain (CL domain), and P2 has an antigen-binding CI ight chain constant domain (CL domain), and P2 has an antigen-binding CI ight chain constant domain (CL domain), and P2 has an antigen-binding CI ight chain constant domain (CL domain), and P2 has an antigen-binding CI ight chain constant domain (CL domain), and P2 has an antigen-binding CI ight chain constant domain (CL domain), and P2 has an antigen-binding CI ight chair call ight chair call growth factor (VEGF) receptor; reducing tumour growth; inhibiting ungiogenesis; CI reducing endothelial cell proliferation, inhibiting vEGF induced CI is ligand; promoting interactions between immune cells and target cells; CI and in vivo and in vitro for investigative, diagnostic or treatment CI methods. The design of (I) provides for efficient production so that CI is ubstantially all of the antigen-binding proteins produced are assembled CI in the desired configuration. (I) is bivalent and bispecific, homogeneous and in tetrameric form. The heavy chain constant domains which constitute the FC region (e.g., CH2 and CH3 for an IgG molecule) of a natural CI is no requirement for processing in vitro to obtain the complete product. CI is no requirement for processing in vitro to obtain the complete product. (scFv), an engineered protein containing a variable light and variable for invention.
                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

The bispecific antigen-binding proteins block activation of the VEGF receptor and are useful for reducing or inhibiting VEGF induced cellular functions such as mitogenesis of vascular endothelial cells and migration of leukaemia cells. The antibodies are useful for treating tumours and for in vivo or in vitro for investigative and diagnostic methods. This sequence represents a mouse protein relating to the bispecific antibodies that bind to the VEGF receptors of the invention.
